DETAILED ACTION

Claims 1-10 and 12-16 are presented for examination.

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 1-10 and 12-16 are rejected under 35 U.S.C. 103(a) as being unpatentable over Hong et al. (hereinafter 'Hong') US 6,646,894 in view of Kohout et al. (hereinafter 'Kohout') US 6,969,979.

Hong was cited as the prior art reference in the last office action. His relevant teachings as set forth in the last office action are hereby incorporated by reference to the extent that is applicable to the newly amended claims.

As to claim 1, Hong teaches all of the claimed limitations except the stopping operation of the control circuit part and.

Kohout teaches a similar power saving apparatus used in a switching regulator. Kohout further teaches stopping operation of the control circuit part [col. 7, lines 18-21].

It would have been obvious to one of ordinary skill in the art to have combined the teachings of Hong and Kohout because they are both directed towards a switching power supply with a low power mode. Furthermore, Kohout improves upon Hong because Kohout allows more power to be saved by completely stopping operation of the control circuit during the low power mode.

It would have also been obvious to one of ordinary skill in the art to have integrated the switching transistor, the control circuit part, and the clock signal detector circuit into a single IC because Kohout teaches that the switching regulator is used in a portable electronic device [col. 1, lines 30-33]. Typically, a portable device includes circuitry on an integrated circuit. Therefore, it would have been obvious to include the various components of the switching regulator on an IC.

As to claims 2-10 and 12, Hong teaches these claims as cited in the previous office action.

As to claims 13-16, Hong and Kohout teach these claims according to the reasoning set forth in claim 1 supra.

Response to Arguments

Applicant's arguments with respect to claims 1-12 have been considered but are moot in view of the new ground(s) of rejection.
